DRAFT · 07 NOV 2026

AegisPay

Let an agent choose useful data.
Keep the spending authority bounded.

Agent chooses → Tools check → Noir limits → Velo executes

Current proof: headless SDK integration. One real authorization and a separate claim.
The model loop, database, application UI and deployment remain unfinished.

Salvador Vincent Javier · solo builder · 5-minute pitch + 3-minute Q&A
Two-minute submission recording is a separate, pending deliverable.

WORKFLOW HYPOTHESIS

A new data source should not require open-ended payment authority.

For a small agent team, the useful unit to test is one task, one quote and one auditable purchase.

DEVELOPER

“Get the useful report.”

The agent may discover a paid resource while working. Its owner still needs a finite budget and expiry.

API PROVIDER

“Prove this purchase.”

A payment must match the merchant, amount and quoted resource before protected data is released.

WHEN STATUS IS UNCLEAR

“Did it already pay?”

A timeout must preserve identity. A second signature or blind submission can create another charge.

> Prepaid API keys can work well. We are testing whether bounded, per-request wallet purchasing improves this specific workflow. **Demand and pricing are unvalidated.**

Source: PRD / core journeys, BR-003 and invariants · No customer, revenue or market-size claim.

INTENDED APP FLOW · UNBUILT

Choose usefulness. Never choose the rules.

Practical example: an agent developer requests a report to answer a task. Both report contents are fictional fixtures.

QUICKSIGNAL

0.03 XLM

300000 stroops
Within the demo cap

DEEPTRACE

0.12 XLM

1200000 stroops
Above the demo cap

Demo cap: 0.1 Testnet XLM / 1000000 stroops.
Per-payment cap and planned per-run budget ceiling.

SELECTED BEHAVIOR · STILL TO BUILD

Model proposes intent

Discover offers → choose a useful resource → request the current HTTP 402 quote.

Trusted tools decide permission

Validate immutable terms, reserve budget and enforce policy. Keys, price and signing stay outside the model.

Saved spike: configured headless payment, not an autonomous model choice or protected-resource delivery.

Sources: PRD / UJ-002, BR-002, F-005 · Separate two-minute recording plan · No live app demo available.

HEADLESS · TESTNET ONLY

Two SDKs.
The same authorization.

01 · NOIR 0.3.0

Prepare & sign

Constrained agent authorizes escrow against the mandatory October 24 contracts.

→

02 · VELO 1.0.0 GAS

Sponsor & submit

Persist reservation identity and handoff marker before submitting that signed invocation.

→

03 · INDEPENDENT RPC

Match & confirm

Successful Velo execution must agree with envelope, invocation and Noir event evidence.

Implemented: guarded spike adapters and a local single-operation journal. Stellar SDK 16.4.1. No custom contract redeployment.

Target app, unbuilt: apps/web ↔ PostgreSQL ↔ private apps/server; packages/agent + packages/shared. App database races remain unproved.

Gas is the actual Velo role. Organizer-specific acceptance of this interpretation remains unconfirmed.

Sources: Velo handoff code · Independent verifier · Verified contract IDs / ABI

SAVED REAL RUN · NOT A MODEL PURCHASE

One authorization. Separate claim.

0.03 Testnet XLM

300000 stroops · nonce 1 · authorization ledger 5607680

The saved report matches Velo execution to the independent successful Stellar envelope, invocation and Noir event.

Re-observation used the same identity.
Multiple reports do not create another purchase.

STATE / STROOPS	ESCROW	MERCHANT PENDING
Before	10000000	0
Authorized	9700000	300000
Claimed separately	9700000	0

Refusal also observed: 1200000 against a 1000000 cap. Actual deployed-contract simulation; unsigned and unsubmitted. Not an included failed transaction.

Latest observation: 2026-11-07 15:23:19 UTC.
Post-review opt-in acceptance: 51/51, no failures or skips, recorded at source. Not rerun for this deck.

Inner · 1d39c3e3…12fa7a ↗ Outer / event · 6e898ad8…33d381 ↗ Claim · 94cea8bb…0c9a18 ↗

Inner and fee-bump outer identify one authorization. The event reported the outer hash. Claim is a distinct transaction.

SPIKE PROOF ≠ APP RELEASE

Uncertainty must not become a second payment.

PERSIST BEFORE DISPATCH

One handoff

Save reservation identity and the durable marker. Keep the signed call out of evidence and client code.

→

TIMEOUT / UNKNOWN

Observe that identity

No re-signing or redispatch. Unknown stays unresolved and cannot release protected data.

→

ONLY AFTER AGREEMENT

Verify, then deliver

Velo + envelope + invocation + event. Event alone omits asset and agent.

Implemented in the spike

Persisted nonce and handoff guards, identity-only recovery, independent evidence matching and terminal cleanup.

Required app gates · pending

Immutable quotes, atomic budget reservation, unique entitlements and owner/quote/resource binding under PostgreSQL races.

Sources: Handoff / recovery implementation · INV-001–INV-010 · App acceptance plan

PROPOSED PILOT · NOT TRACTION

Start with one developer and one paid API provider.

Test whether bounded purchasing solves a recurring task before claiming a business.

01 · INTEGRATE

One narrow workflow

Choose a real report category with the developer. Replace fixture content only after provider permission and app gates.

02 · OBSERVE

Delivery correctness

Measure setup friction, denied purchases, unresolved recovery and whether the paid resource reaches its rightful owner.

03 · DECIDE

Value and actual costs

Interview both sides. Measure model, hosting, RPC and sponsorship costs before testing a gateway subscription or usage fee.

> No interviews, customers, revenue, market-size estimate, sustainable margins or production security audit are established.

LOCAL DRAFT · UNPUBLISHED

A real payment foundation.
A complete application still ahead.

DONE AT SOURCE CHECKPOINT

SDK harness + same-transaction gate

TASK-001 and TASK-002 complete, including reviewed recovery and fee reconciliation fixes. One authorization and separate claim.

Ask: feedback on the workflow, and a future developer pilot.

github.com/slvdrvncntjvr/AegisPay ↗

NEXT MILESTONES · ALL PENDING

01 Real workspaces → PostgreSQL, authenticated APIs and payment recovery.

02 Real bounded model → protected resource → UI and release gates.

03 Deploy app, worker and database → record two-minute video → publish deck.

Missing public assets: app URL, video URL, published deck URL.
Discord handle and registration confirmation pending.
This local PDF preparation does not complete TASK-013.

The Nov 7, 2026 noon Philippine-time deadline has passed; no extension or eligibility assurance is supplied.
Organizer-specific Gas interpretation and late acceptance remain open. Three-minute Q&A follows; recording is separate.
